

APP DEVELOPMENT WITH FLUTTER

IMPLEMENT SIMPLE ARITHMETIC CALCULATOR IN FLUTER:

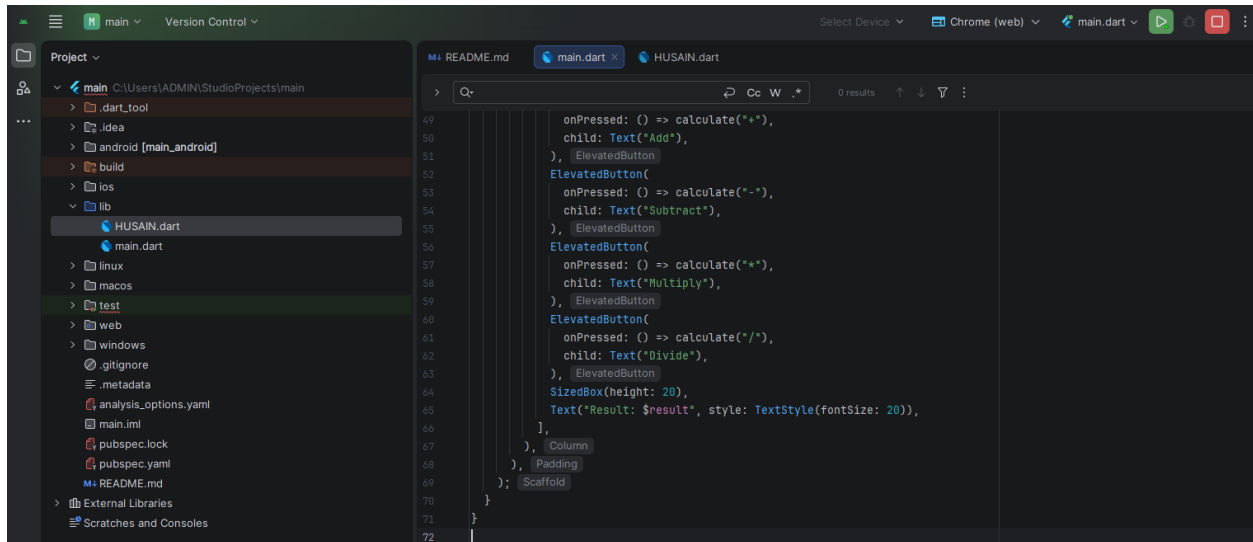

Code:

```
1 import 'package:flutter/material.dart';
2
3 void main() => runApp(MaterialApp(home: Calculator()));
4
5 class Calculator extends StatefulWidget {
6   @override
7   State<Calculator> createState() => _CalculatorState();
8 }
9
10 class _CalculatorState extends State<Calculator> {
11   TextEditingController n1 = TextEditingController();
12   TextEditingController n2 = TextEditingController();
13
14   double result = 0;
15
16   void calculate(String op) {
17     double a = double.parse(n1.text);
18     double b = double.parse(n2.text);
19
20     setState(() {
21       if (op == "+")
22         result = a + b;
23       else if (op == "-")
24         result = a - b;
25       else if (op == "*")
```

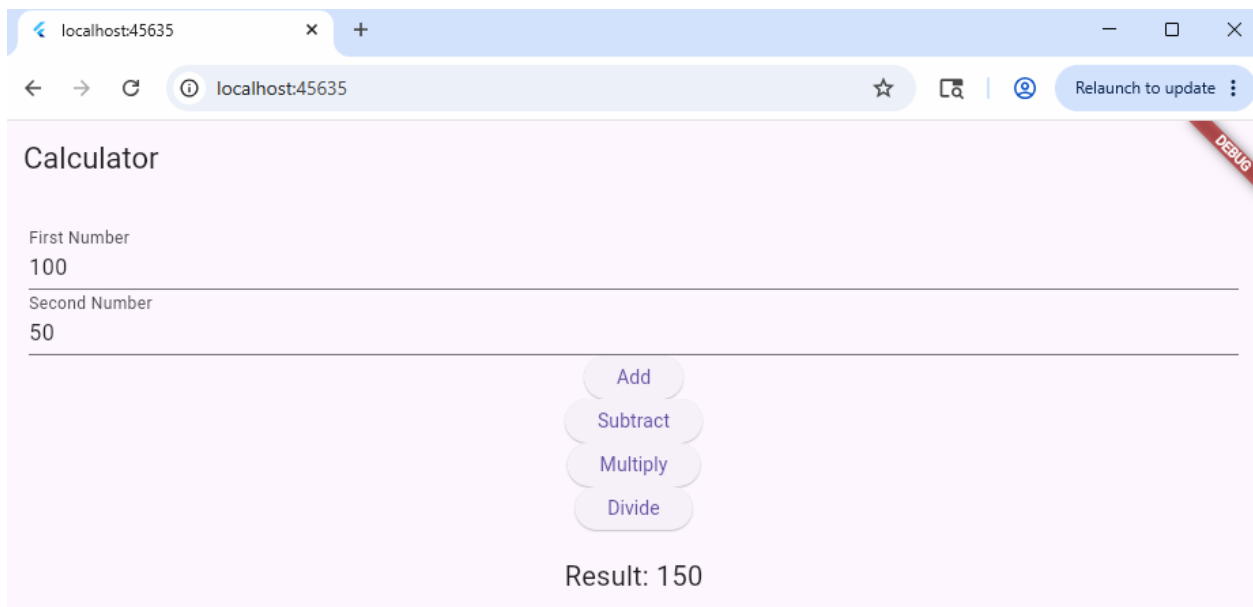

```
25     else if (op == "*")
26       result = a * b;
27     else if (op == "/")
28       result = a / b;
29   });
30 }
31
32 @override
33 Widget build(BuildContext context) {
34   return Scaffold(
35     appBar: AppBar(title: Text("Calculator")),
36     body: Padding(
37       padding: EdgeInsets.all(20),
38       child: Column(
39         children: [
40           TextField(
41             controller: n1,
42             decoration: InputDecoration(labelText: "First Number"),
43           ),
44           TextField(
45             controller: n2,
46             decoration: InputDecoration(labelText: "Second Number"),
47           ),
48           ElevatedButton(
49             onPressed: () => calculate("+"),
```

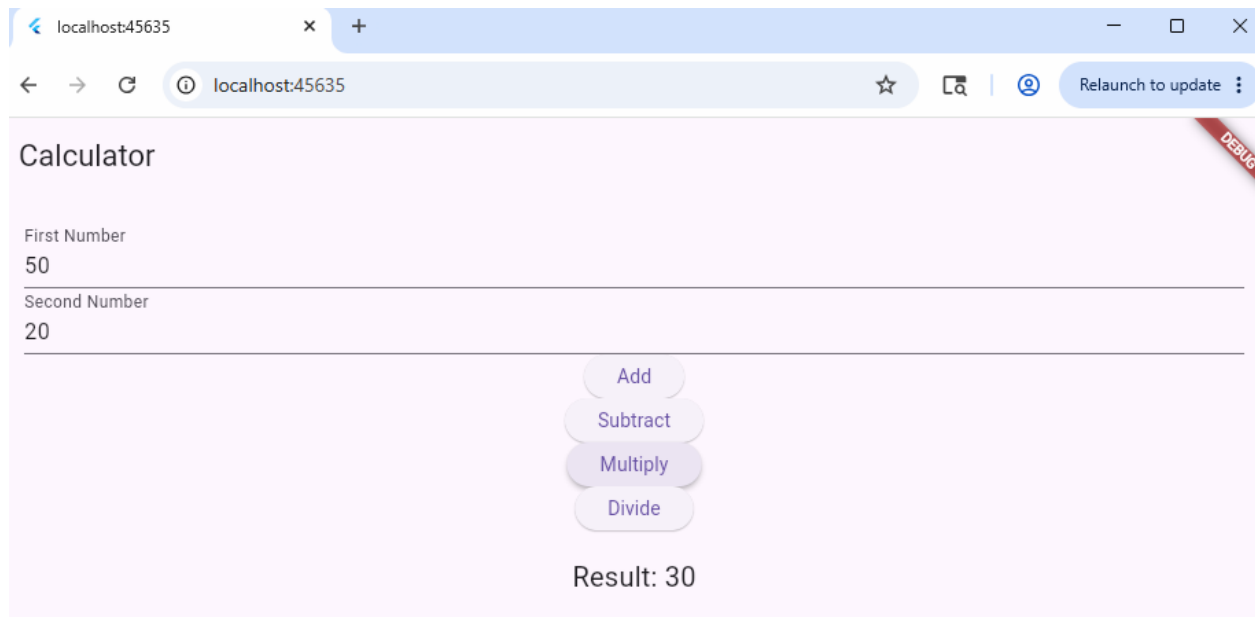

```
49         onPressed: () => calculate("+"),
50         child: Text("Add"),
51       ),
52     ElevatedButton(
53       onPressed: () => calculate("-"),
54       child: Text("Subtract"),
55     ),
56     ElevatedButton(
57       onPressed: () => calculate("*"),
58       child: Text("Multiply"),
59     ),
60     ElevatedButton(
61       onPressed: () => calculate("/"),
62       child: Text("Divide"),
63     ),
64     ElevatedButton(
65       onPressed: () => calculate(""),
66       child: Text("Result: $result", style: TextStyle(fontSize: 20)),
67     ),
68   ],
69 );
70 
```

Output:

Addition:

Subtraction:

localhost:45635

localhost:45635

Relaunch to update

Calculator

First Number
50

Second Number
20

Add
Subtract
Multiply
Divide

Result: 30

Multiplication:

localhost:45635

localhost:45635

Relaunch to update

Calculator

First Number
300

Second Number
3

Add
Subtract
Multiply
Divide

Result: 900

Division:

Explanation:

Widget	Purpose
MaterialApp	The root widget of the application. It provides Material Design features and sets up the app.
StatefulWidget	Creates a widget whose data can change while the app is running. Used because the calculator result changes.
Scaffold	Provides the basic page layout, including the AppBar and body.
AppBar	Displays the title bar at the top of the application.
Padding	Adds empty space around the widgets to make the UI look neat.
Column	Arranges widgets vertically, one below another.
TextField	Accepts input from the user. Here it is used to enter the two numbers.
InputDecoration	Adds labels and styles to the TextField (e.g., "First Number").
TextEditingController	Controls and retrieves the text entered in the TextField.
ElevatedButton	Creates clickable buttons for Addition, Subtraction, Multiplication, and Division.
SizedBox	Adds empty space between widgets.
Text	Displays text on the screen, such as the result.
